add a/c add B/c add C/c  
1. An axle driving appar

(upper half casing and lower half casing, the axis of said motor shaft is positioned on the dividing line of said transmission casing, and bearings for said motor shaft are held between said upper half casing and said lower half casing.

3. An axle driving apparatus according to Claims 1 and 2, characterized in that said center section is provided at the pump mounting surface thereof with a rotary surface of a pump cylinder block and a bearing for said pump shaft and at said motor mounting surface with a rotary surface of a motor cylinder block and a bearing for said motor shaft, said pump mounting surface and motor mounting surface being disposed in an L-like shape, said center section being constituted to be about L-like-shaped when viewed in section.

4. An axle driving apparatus according to Claim 2, characterized in that said center section is mounted to said upper half casing, the casing mounting portion extending on the same plane as said pump mounting surface at said center section so as to be on the same plane as the butt joint surface of said upper half casing with respect to said lower half casing.

5. An axle driving apparatus according to Claims 1, 2 and 4, ~~characterized in that said center section~~

6. An axle driving apparatus according to Claim 3, characterized in that said bearings for said pump shaft and motor shaft use spherical bushes respectively.

6. An axle driving apparatus according to Claim 3, characterized in that said bearings for said pump shaft and motor shaft use spherical bushes respectively.
